

WSSRAP

UPDATE

VOL. 6 NO. 1

JUNE 1994

Distributed to residents of St. Charles County to report on the progress of the Weldon Spring Site Remedial Action Project

35 OF 44 STRUCTURES REMAINING

Chemical Plant Building Demolition

Cleaning and dismantling the 44 buildings and structures of the former manufacturing operation began in June, 1991.

Today, 35 of these structures have disappeared and eight are in process. As the chemical plant area is cleared, the stack of building debris in the materials storage area grows higher.

Project Manager Lacy Key, who is in charge of the dismantling and waste handling operations, says the most positive feature of this work is that it was done safely. "We've had no serious injuries since this work started 24 months ago," he says.

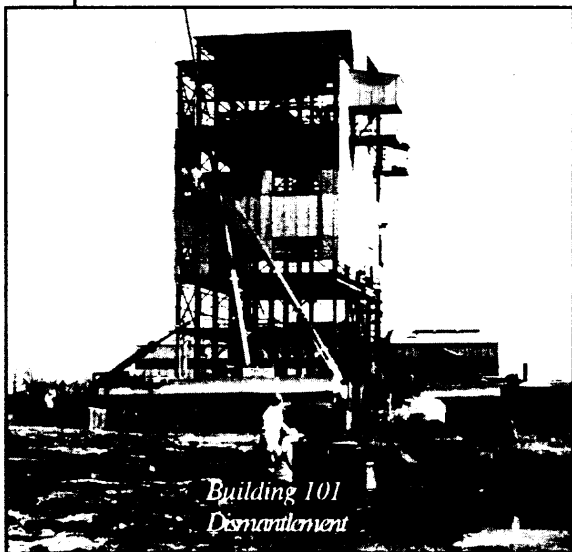

Mr. Key is particularly proud of the fact that two of the three demolition

Structural steel and other building debris being stacked in the Material Staging Area.

subcontracts were each completed two months ahead of the DOE Headquarters milestones.

Four subcontractors have been working on the dismantlement of the buildings that includes cleaning, decontaminating, removing process pipe and asbestos materials and demolishing equipment. They are Kimmins Industrial Services Corporation, B&W/OHM, Iconco/National and Unnerstall Construction. Kimmins and Iconco have completed their work.

Cover photo shows workmen removing transite panels from building 101, the six-story feed preparation and sampling structure.

Quarry Cleanup: Site Reaches Two Important Milestones

Over 2,100 loads of bulk waste removed from Quarry

More than 2,100 truck loads of bulk waste from the quarry have been transported over the dedicated haul road to the temporary storage area at the chemical plant property. This represents over 25,000 cubic yards of material.

Except for weather shut-downs, covered trucks hauling waste have averaged better than 20 trips per day. Gene Valette, bulk waste project manager, estimates that the quarry cleanup activity is now about 30 percent complete.

Quarry water treatment plant update

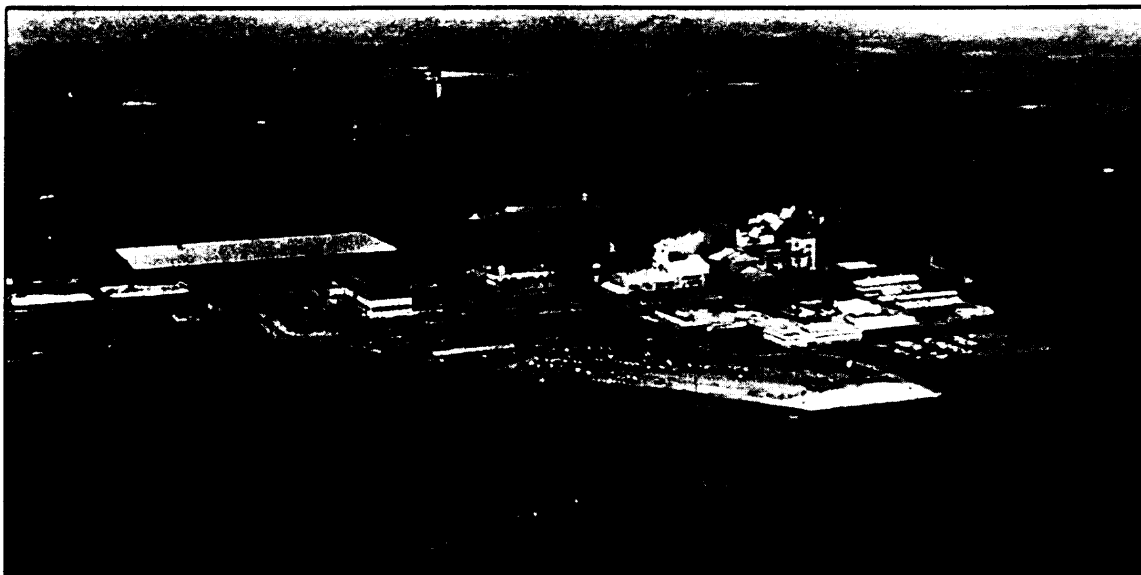

The quarry water treatment plant has treated and discharged at least 20 batches of water from the quarry in compliance with the State of Missouri permit.

This activity is an attempt to keep the sump at a low level despite the spring rains so work can progress on bulk waste removal. Levels of water in the pond have ranged from nine feet down to three feet at various times during the last four months. Before treatment began, the pond had 17 feet of water.

Waste Disposal

The engineered disposal facility, or cell, to be constructed in the chemical plant area will provide long-term isolation of the site's waste material. The footprint of the facility will cover about 72 acres on an area tests show is geologically suitable. Average

County Citizen's Commission Plans Nearing Completion

Arrangements are nearing completion with St. Charles County Administration to establish a St. Charles County Citizen's Commission that will provide a two-way communications link between the Weldon Spring cleanup activity and the general public.

Steve McCracken, Department of Energy Project Manager at the site, says a federal grant will fund the commission.

"The plan that we have worked out with the County is to have about seven members who represent a cross-section of the St. Charles County population. They will monitor Project activities and serve as an information resource for the

entire community," Mr. McCracken says. "This is extremely important as the cleanup activity enters the waste treatment and disposal phase of the Project."

"One responsibility of the commission," he adds, "will be to meet frequently, to review progress and to monitor the cleanup activities. We anticipate that the commission will tell us what people in the area are thinking and at the same time tell the public how we are doing."

Mr. McCracken says this form of public participation is welcomed by the Department of Energy and that he expects the commission to be formed and ready to function later in the year.

State Renews Discharge Permit For Site Water Treatment Plant

The Missouri Department of Natural Resources (MDNR) has renewed the permit for the Project to release into the

Missouri River water treated at the site water treatment plant.

The renewal, discussed at a public meeting February 17, was granted following a public comment period.

The original permit was granted in January, 1991. It allowed discharge of treated water through a natural drainage ditch that eventually led to the Missouri River. The ditch was never used because studies showed that the ditch is contaminated by storm water runoff from the chemical plant area. Instead, the Department of Energy constructed a pipeline to the river as a conservative alternative.

The public meeting, held at the St. Peters Holiday Inn, was co-hosted by DOE. A number of exhibits, staffed by WSSRAP scientists, provided

Bruce Ballew making a presentation at the NPDES Permit Meeting, February 17.

Discharge Permit

Continued from page 6

information on cleanup progress.

Dan Shuette, Chief of the State's National Pollutant Discharge Elimination System (NPDES) section, was the moderator. WSSRAP's Bruce Ballew gave a brief slide presentation that outlined the water treatment process and the water testing program.

The new permit incorporates some changes including the reduction of some monitoring parameters that have been determined to be unnecessary and the addition of new monitoring locations.

"The changes in the revised permit for the Chemical Plant area, including the site water treatment plant," Mr. Ballew says, "reflect the experience gained during the past several years of operation."

He reported at the meeting that the site water treatment plant had processed 18 batches of water amounting to 14 million gallons. Mr. Ballew also presented data from analytical results (see chart below) that showed contaminants of concern in the treated water have never exceeded the limits set by the state permit.

Cleanup Oversight By Army and State

Two government agencies are now providing on-site oversight of the Weldon Spring Site Remedial Action Project. They are the U. S. Army Corps of Engineers and the Missouri Department of Natural Resources (MDNR).

MDNR, working under a multi-year Department of Energy grant, has assigned

Ray Allison

Karen Marcus, Martha Kopper and Geri Kountzman

three full-time people to stay in touch with daily activities of the Project. Geri Kountzman and Martha Kopper are located onsite and Karen Marcus is located at MDNR offices in Jefferson City.

The Corps of Engineers has assigned Ray Allison to maintain an office at the site. His responsibilities are to review engineering designs and conduct field surveys of work that is being partially funded by the Army.

Tom Pauling Joins DOE

Tom Pauling has joined the Department of Energy staff as Environmental Engineer.

His oversight duties span the Environmental Safety and Health and Compliance departments. Mr. Pauling was formerly associated with the Environmental Protection Agency in Denver.
